

Spinnaker - Manual Processes

Major Note: Deployments are not working through the pipelines. So a lot of troubleshooting to get it to deploy correctly.

For Caliber:

- All Caliber projects are configured to Bake and Deploy.
- Manually reconfigure pipelines if necessary.

For New Projects:

- Pipelines for new projects would have to be manually created and configured.
 - Create new application
 - Create new pipeline
 - Define stages (these can be copied from previous pipelines using the JSON provided in UI)
 - Honestly easier to do by hand, since you'll still have to go and change things like artifacts, images, etc...)
